INDIVIDUAL CONTRIBUTION
MiniOS ALPHA IT3131

Student Name: Bern Ryan M. Pelingon

Group: Alpha

Assigned Role: LEADER/ Technical Documentation / Running Commands/ ScreenRecording the commands.

What did I contribute to the project?

As the leader of the group, I helped organize and coordinate the project to ensure that the tasks were completed properly. I was responsible for preparing the technical documentation, running the commands to test the MiniOS Alpha simulator, and recording the execution of the commands as evidence of the system's functionality. I also helped ensure that the documentation matched the actual features and implementation of the project.

What features did I personally develop?

My main contributions focused on the technical documentation and testing of the MiniOS Alpha simulator. I documented the system's features, including command-line operations, file management, process management, simulated memory management, user management, and system information. I also executed the available commands to verify their behavior and recorded the demonstrations for project presentation and documentation purposes.

What problems did I encounter?

One of the challenges I encountered was ensuring that the technical documentation accurately reflected the actual implementation of the system. I also had to make sure that the commands were executed correctly during testing and screen recording. Another challenge was understanding and explaining how the simulator handled its different functions, particularly simulated memory management.

How did I solve those problems?

I addressed these challenges by reviewing the source code, testing the available commands, and comparing the system's actual behavior with the technical documentation. I repeated command executions when necessary to ensure that the demonstrations were clear and correct. I also revised the documentation to make the explanations more accurate and consistent with the implemented features.

What did I learn from this project?

Through this project, I learned the importance of leadership, teamwork, technical documentation, and system testing in software development. I gained a better understanding of how operating system concepts, such as file management, process management, and memory management, can be simulated in a program. I also learned that documentation must be based on the actual implementation and that testing and recording system operations provide valuable evidence of a project's functionality.

Evidence of My Contribution

The following materials can serve as evidence of my individual contributions:

1. **Technical documentation** – the document I prepared or revised to explain the MiniOS Alpha system and its features.
2. **Command execution screenshots** – screenshots showing the commands I executed and their corresponding outputs.
3. **Screen recording** – a video demonstrating the execution of the MiniOS Alpha commands.
4. **Testing results** – recorded outputs showing the behavior of the simulator's implemented features.
5. **Source code review** – relevant code sections I reviewed to ensure that the technical documentation accurately described the system.
6. **Group coordination records** – relevant task assignments, discussions, or updates demonstrating my responsibilities as the project leader.

Student Name: Ralph Christian Gatuteo

Group: Alpha

Assigned Role: CLI Developer

What did I contribute to the project?
I am assigned to develop the main interface of MiniOSAlphaSC1063, including the command prompt and command processing. I also worked on the help, clear, and exit commands.

What features did I personally develop?
I developed the command prompts where users enter commands and the processing that connects each command to its function. I also added commands to display help, clear the screen, and close the program.

What problems did I encounter?
When users entered unknown commands or commands with missing information, the program did not catch these and output nothing or an index error.

How did I solve those problems?
I added the command names and the information needed by each command. I caught these errors to prevent Python from showing technical error messages. I added specific error messages to explain what went wrong to guide users in inputting a correct command format.

What did I learn from this project?
I learned that checking user input helps prevent errors and keeps the program running properly. I also learned that the workload becomes lighter when everyone does their assigned tasks and helps each other.

Evidence of my contribution:
This report should be uploaded to the group's GitHub repository.

Student Name: Clarrise Marie Pineda

Group: Alpha

Assigned Role: Documentation Developer / User Manual Writer

What did I contribute to the project?
I was assigned to create the user manual of MiniOSAlphaSC1063. I also helped in the documentation paper of the project by writing and organizing some of its parts.

What features did I personally develop?
I created the user manual that explains how to run the program and how to use its commands, with step-by-step instructions and sample inputs so users can follow them easily. I also helped prepare the documentation paper that describes the system, its features, and how it works.

What problems did I encounter?
It was difficult to explain how each command works because I first had to understand the program and its expected input and output. Some features also changed while the project was being developed, so parts of the manual became outdated. Another problem was explaining technical steps in simple words for users who are not programmers.

How did I solve those problems?
I ran the program myself and tested the commands, and I asked my groupmates when something was unclear. I updated the manual whenever a feature changed, so it matched the final version of the program. I used short, simple sentences and sample commands so the instructions are easy to understand.

What did I learn from this project?
I learned that clear documentation is as important as the program itself, because users need guidance to use the system correctly. I also learned that teamwork and communication are important, because I needed my groupmates' explanations and finished work to document the system accurately.

Evidence of my contribution:
This report, together with the user manual and the documentation paper I worked on, is uploaded to the group's GitHub repository.

Student Name: Jamir Adrian Gayorgor

Group: ALPHA

Assigned Role: Error Handling and Testing

What did I contribute to the project?
the one in which I contributed was during the testing I personally suggested some changes to our leader like the admin and password during the initial opening of the miniOS.

What features did I personally develop?
The only thing I personally developed was the login process and then after that I just went to testing other features whether it works and suggesting some improvements .

What problems did I encounter?
The problems that I've encountered was that the mini os isn't a simple process because there are many steps into doing it and using it.

How did I solve those problems?
I solved those problems with my group members' help and guidance.

What did I learn from this project?
I learned that it is not simple to create a miniOS and that it needs everyone's cooperation so that the work or testing would be easier to do.

Evidence of my contribution:
This report should be uploaded to the group's GitHub repository.

Student Name: Thomas Joseph Bomban

Group: ALPHA

Assigned Role: File, Process, and User management

What did I contribute to the project?
I tested the most of the File, Process, and User management features in the MiniOs

What features did I personally develop?
A few parts in the User management

What problems did I encounter?
At first I struggled to understand how some features worked

How did I solve those problems?
By taking my time in understanding the many different features of the MiniOs

What did I learn from this project?
I learned that in order to make this project possible. Cooperation and the distribution of work among members is necessary

Evidence of my contribution:
This report should be uploaded to the group's GitHub repository.

Student Name: Jeriko Hermonio

Group: Alpha

Assigned Role: User

What did I contribute to the project?
I developed the Help program of the Mini OS, which shows users the available commands, what each one does, and how to type it correctly.

What features did I personally develop?
I built the command prompt and the processing that connects each command to its function. For the Help program, I created the help command that lists all commands with short descriptions and usage formats. I also added the clear and exit commands and included them in the Help list.

What problems did I encounter?
Unknown commands or commands with missing information were not handled. The program either printed nothing or showed an index error.

How did I solve those problems?
I registered each command name with the information it needed, caught the errors so Python no longer shows technical messages, and added clear error messages such as "Unknown command. Type help to see available commands."

What did I learn from this project?
I learned that checking user input prevents errors and keeps the program running properly. I also learned that the workload becomes lighter when everyone does their assigned tasks and helps each other.

Evidence of my contribution:
This report should be uploaded to the group’s GitHub repository.
